On s'intéresse à l'implémentation d'une liste simplement chaînée circulaire, c'est-à-dire une liste pour laquelle la dernière position de la liste fait référence, comme position suivante, à la première position de la liste.

L'ajout d'un nouvel élément dans la file (méthode enqueue) se fait en fin de liste et le retrait (méthode remove) se fait a un *index* particulier de la liste. Une (seule) référence sur la fin de la liste (last) est nécessaire pour effectuer toutes les opérations sur cette file.

Il vous est donc demander d'implémenter cette liste simplement chaînée circulaire à partir de la classe CircularLinkedList.java où vous devez completer (TODO STUDENT):

- la méthode d'ajout (enqueue);
- la méthode de retrait (remove) [L'exception IndexOutOfBoundsException est lancée quand la valeur de l'index n'est pas comprise en 0 et size()-1];
- l'itérateur (ListIterator) qui permet de parcourir la liste en FIFO.

Attention: L'itérateur devra lancer des exceptions dans les cas suivants:

- étant donnée que le remove est optionnel dans l'<u>API</u>, l'iterateur devra juste lancer un UnsupportedOperationException en cas d'appel du remove;
- étant donnée qu'on ne peut modifier l'itérateur alors qu'on est en train d'itérer, l'iterateur devra lancer un ConcurrentModificationException dans ce cas dans le next et le hasNest;
- si le next est appelé alors qu'il n'y a plus de prochain élément, l'iterateur devra lancer un NoSuchElementException.

```
import java.util.ConcurrentModificationException;
import java.util.Iterator;
import java.util.NoSuchElementException;
public class CircularLinkedList<Item> implements Iterable<Item> {
private long nOp = 0; // count the number of operations
                          // size of the stack
private int n;
private Node last; // trailer of the list
 // helper linked list class
 private class Node {
     private Item item;
     private Node next;
 }
 public CircularLinkedList() {
     last = null;
     n = 0;
 }
 public boolean isEmpty() { return n == 0; }
 public int size() { return n; }
 private long nOp() { return nOp; }
  * Append an item at the end of the list
  * @param item the item to append
  */
```

```
public void enqueue(Item item) {
     // TODO STUDENT: Implement add method
 }
 /**
 * Removes the element at the specified position in this list.
  * Shifts any subsequent elements to the left (subtracts one from their
  * Returns the element that was removed from the list.
 */
 public Item remove(int index) {
     // TODO STUDENT: Implement remove method
 }
 \star Returns an iterator that iterates through the items in FIFO order.
 \star @return an iterator that iterates through the items in FIFO order.
 public Iterator<Item> iterator() {
    return new ListIterator();
 }
 * Implementation of an iterator that iterates through the items in FIFO
order.
 *
 */
 private class ListIterator implements Iterator<Item> {
    // TODO STUDENT: Implement the ListIterator
}
}
```

Question 1: Implementation de la fonction ajout: void enqueue(Item item)

```
/**
  * Append an item at the end of the list
  * @param item the item to append
  */
public void enqueue(Item item) {
      // TODO STUDENT: Implement add method
}
```

Copier le contenu de la fonction public void enqueue(Item item) ci-desssous.

```
1 if (n==0){
 2
                 last=new Node();
 3
                 last.item=item;
 4
                 last.next=last;
 5
            }
            else{
 6
 7
                 Node premier=last.next;
                 last.next=new Node();
9
                 last.next.item=item;
                 last.next.next=premier;
10
                 last=last.next;
11
12
            }
13
             n0p++;
14
             n++;
```

Question 2: Implementation de la fonction ajout: Item remove(int index)

```
/**
 * Removes the element at the specified position in this list.
 * Shifts any subsequent elements to the left (subtracts one from their indices).
 * Returns the element that was removed from the list.
 */
public Item remove(int index) {
    // TODO STUDENT: Implement remove method
}
```

Copier le contenu de la fonction public Item remove(int index) ci-desssous.

```
1 if(index < 0 || index > n-1){
                 throw new IndexOutOfBoundsException();
 3
            }
 4
            Node iter = last;
 5
            for(int i = 0; i < index; i++){</pre>
                 iter=iter.next;//il va s'arreter pile avant le node a
   retirer
 7
            Item theItem = iter.next.item;
            iter.next=iter.next.next;//plus de lien vers le node a
9
   supprimer sauf le last si c'est lui!!/!\
10
            if (index==n-1){
11
                 last=iter;
12
            }
            if (n==1){
13
14
                last=null;
15
            }
16
            n0p++;
17
            n--;
18
            return theItem;
```

Question 3: Implementation de l'iterateur: ListIterator

```
/**
 * Implementation of an iterator that iterates through the items in
FIFO order.
 *
 */
private class ListIterator implements Iterator<Item> {
    // TODO STUDENT: Implement the ListIterator
}
```

Copier le contenu de la class private class ListIterator implements Iterator<Item> cidesssous.
